SaySo

AI that writes the way you'd say it.

Your own voice, adapted to who you're talking to — in any messenger.

Built on Meta Muse Spark 1.3 + Muse Glimmer 30B · Meta Global AI Developer Hackathon · indie track · solo

THE PROBLEM

AI replies sound like AI, not like you.

- Too long, too polite, perfect punctuation — people notice at once.
- Real chat is short, lowercase, split into several messages, languages mixed.
- You write differently to your partner, your friends and your elders. Generic AI writes the same way to everyone.

HOW THE AUTHOR REALLY WRITES (HELD-OUT MESSAGES)

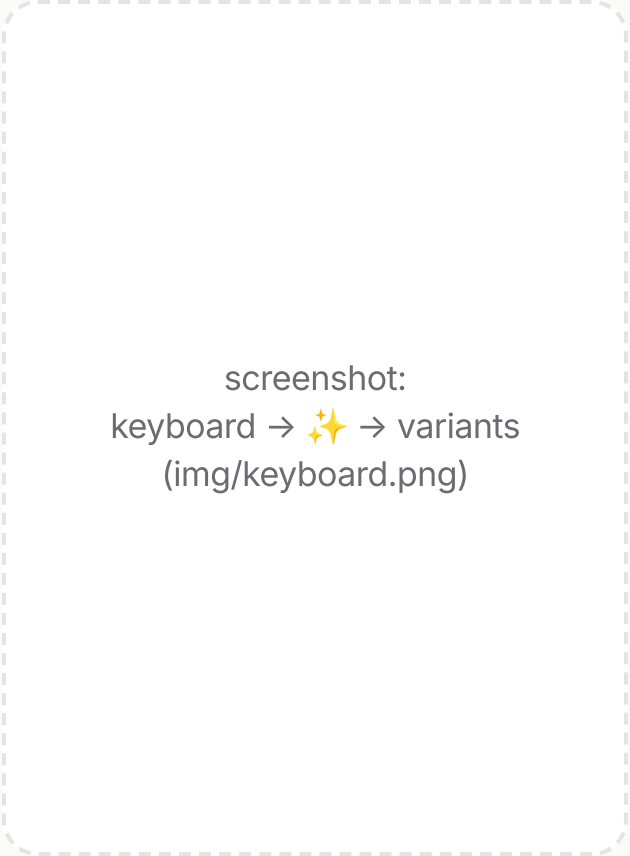

95% start lowercase
4% end with punctuation
~28 characters per turn, **~1.9** messages in a row

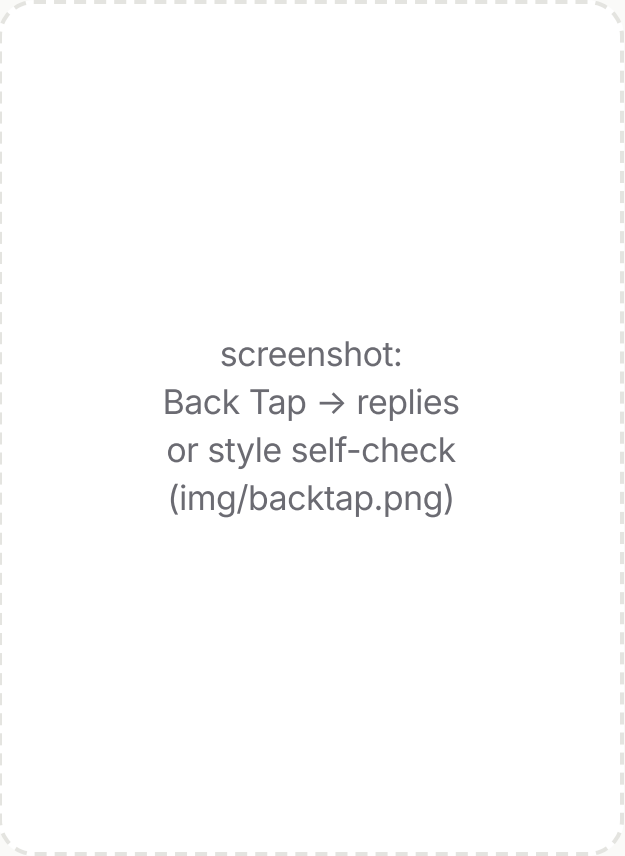

Aggregated form statistics from `eval/results/bench_v4.json`; no message text leaves the author's machine.

THE PRODUCT

A keyboard that writes like you

- **Own keyboard**, RU / EN letter keys; tap ✨ → in your style
- Pick **audience** and **format**: message · series · official · email
- **Series** come as a stack, sent part by part
- **Back Tap** on the iPhone: screenshot → ready replies
- **Styles** built from your uploaded chats, with a self-check
- **Chat and keyboard keep learning** from what you send and fix

HOW IT WORKS

Two Meta models, one voice

META MODEL API

Muse Spark 1.3

Reads uploaded chats and screenshots, understands the situation, drafts what to say.

META OPEN WEIGHTS

Your LoRA on Muse Glimmer 30B

Fine-tuned on your own messages only. Writes the draft in your voice.

IN EVERY PROMPT

Your style, made explicit

Style profile per audience · your real messages as examples · rules learned from your corrections.

Draft → **Spark** (what to say) → **your LoRA** (how you'd say it) → you pick, edit, send. You always send manually.

The style profile describes how you write — length, case, punctuation, emoji, languages — never personality.

RESULTS · MUSE SPARK PATH

Each layer makes it sound more like you

GENERIC MUSE SPARK	+ YOUR STYLE PROFILE	+ YOUR REAL MESSAGES
Form similarity **0.68**	Form similarity **0.91**	Form similarity **0.93**
chrF **39.5**	chrF **46.4**	chrF **53.7**

40 held-out pairs: a neutral draft → what the user really wrote. Same Meta model, only the prompt changes; the last column is what the app runs.

Form similarity = 1 – total variation of form features (length, case, punctuation, emoji, languages) vs the real messages, as in the app's style self-check. chrF = character n-gram overlap with the real message. Source: `eval/style_gain.py` → `eval/results/style_gain.json`.

RESULTS · PERSONAL MODEL

The LoRA thinks first, then writes like you

REPLY LENGTH

24

chars · real 28 · earlier LoRA 38

FORM DISTANCE

0.07

vs 0.12 earlier LoRA (lower is better)

TONE MIX DISTANCE

0.05–0.07

vs 0.09 earlier LoRA

INTENT MATCH

46%

ceiling ~48% · guessing 36.8%

- 499 held-out test pairs. The model writes a short thought (intent + tone) in Glimmer's reasoning channel, then the message.
- The intent is a control: agree, refuse, joke → three replies with different intents, all in your voice.
- **Blind test** (friends guess: real or SaySo?): TODO — results pending.

Source: `docs/PLAN_v4_thinking.md`, `eval/results/bench_v4.json`. Intent ceiling = how often the tagger agrees with itself.

PRIVACY BY DESIGN

Only your own messages are kept

- Trained and prompted **only on what you wrote**.
- Other people's messages are read **in memory** for context, then discarded.
- Uploaded chats are parsed in memory; **screenshots are never stored**.
- The keyboard ignores password, email, URL, one-time-code and search fields.
- See **what it learned from you**; forget any rule.
- Delete a style at any time.
- No sign-up.
- Public repo holds code and aggregated numbers only — no messages, no data.

Positioning: authenticity and your own voice, human in the loop. Not "undetectable AI".

HOW IT SCALES

One base model, one small adapter per user

- **One shared Muse Glimmer 30B** base on the GPU.
- **Per-user LoRA adapters** swapped per request (multi-LoRA vLLM) — a new user adds an adapter, not a GPU.
- Users without their own LoRA yet run on Muse Spark + their style profile.

Cost per active user / month: ≈ **$3** now → ≈ **$1–1.5** optimized. Estimates.

FREE

Muse Spark + your style profile

Styles from your chats, keyboard, Back Tap replies.

PRO · $6.99 / MONTH (ESTIMATE)

Your own LoRA on Muse Glimmer

A personal model trained on your own messages.

ROADMAP

What's next

Accounts

Sync styles across devices, beyond a single-device token.

LoRA training queue

Per-user adapters trained in the background as people upload chats.

Kazakh & more languages

Kazakh first, then any language people write in.

Android

The same keyboard and screenshot replies.

Thank you

SaySo — AI that writes the way you'd say it.

Try it, break it, tell us where it doesn't sound like you.
