SaySo

AI that writes the way you'd say it.

Your own voice, adapted to who you're talking to — in any messenger.

Built on Meta Muse Spark Open (open weights) · Muse Spark 1.3 · Muse Voice Transcribe · Muse Glimmer 30B · Meta Global AI Developer Hackathon · indie track · solo

THE PROBLEM

AI replies sound like AI, not like you.

- Too long, too polite, perfect punctuation — people notice at once.
- Real chat is short, lowercase, split into several messages, languages mixed.
- You write differently to your partner, your friends and your elders. Generic AI writes the same way to everyone.

HOW THE AUTHOR REALLY WRITES (HELD-OUT MESSAGES)

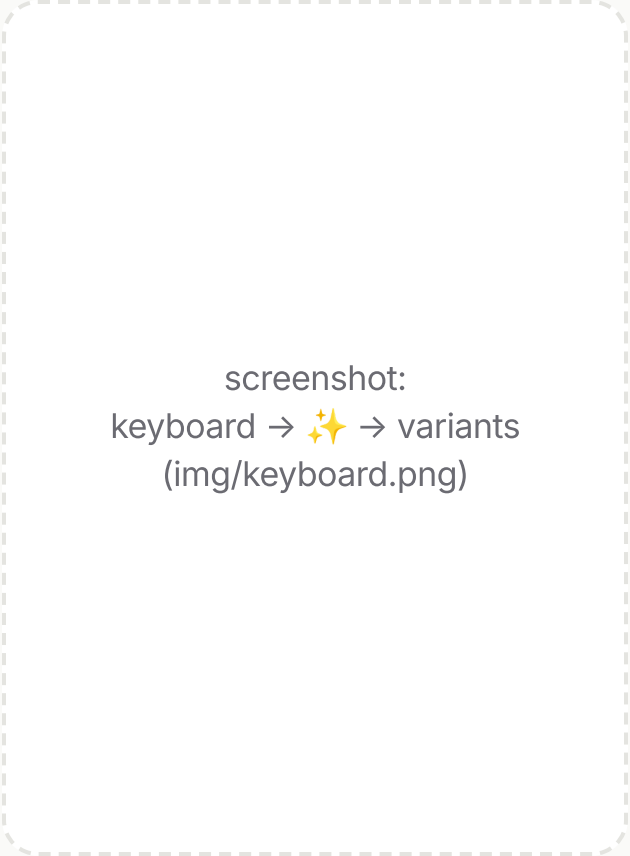

95% start lowercase
4% end with punctuation
~28 characters per turn, **~1.9** messages in a row

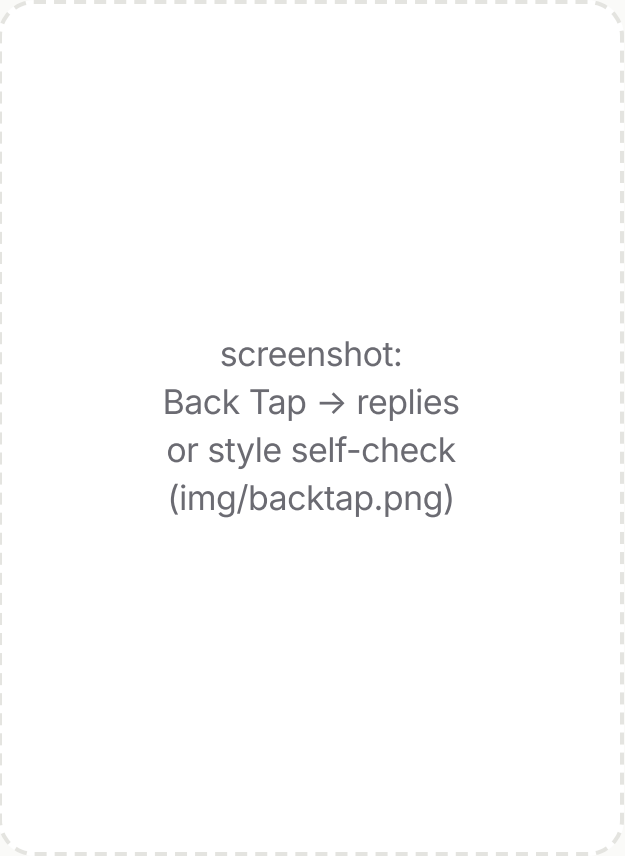

Aggregated form statistics from `eval/results/bench_v4.json`; no message text leaves the author's machine.

THE PRODUCT

A keyboard that writes like you

- **Own keyboard**, RU / EN letter keys; tap ✨ → in your style
- Pick **audience** and **format**: message · series · official · email
- **Series** come as a stack, sent part by part
- **Back Tap** on the iPhone: screenshot → ready replies
- **Chat**: Write · Rewrite · Reply · **Email** · **Essay**, 🎙️ voice input
- **Styles** from your chats, emails and essays, with a self-check
- **Keyboard and chat keep learning** from what you send and fix

THE PRODUCT · FORMAL VOICE

Emails and essays that sound like you, too

- Add **your own** emails and essays: files (.txt · .docx · .pdf · Gmail Takeout), photos of pages, screenshots, paste. Step-by-step guides per app.
- **Essays teach voice only**: word choice, sentence length, linking words. Never structure or topic.
- **Emails teach manner only**: greeting, sign-off, how direct you are. Never content.
- Quoted replies from others and old section labels are cut off.
- **Email**: subject + body from your notes, optionally answering an email you paste.
- **Essay**: plan → text from **your notes only**, structure from the task, first person for personal statements.
- Self-check for AI clichés ("in today's fast-paced world") and length, one fix pass.
- Then up to **3 questions** that would make it stronger: answer by 🎙️ voice or text.

Voice notes: Muse Voice Transcribe 1.0, audio not stored. Photos of pages: read by Muse Spark 1.3, not stored. Source: `serving/documents.py`, `serving/writer.py`.

HOW IT WORKS

Four Meta models, one voice

OPEN WEIGHTS · BASETEN

Muse Spark Open

Writes in your style: ✨, rewrite, compose, chat, email. Fallback for Spark 1.3.

META MODEL API

Muse Spark 1.3

Reads screenshots, chats and photos of your pages; drafts replies, writes essays. Fallback for Spark Open.

META MODEL API

Muse Voice Transcribe 1.0

Listens: 🎙️ notes in Chat become text. Audio not stored.

META OPEN WEIGHTS

Your LoRA on Muse Glimmer 30B

Trained on your own messages and benchmarked. Not hosted live yet (no GPU credits).

In every prompt: **your style profile** per audience × situation · **your real messages** as examples · **your formal voice** · **rules learned** from your corrections. You always send manually.

The style profile describes how you write — length, case, punctuation, emoji, languages, linking words — never personality.

RESULTS · THE LIVE PATH

Each layer makes it sound more like you

GENERIC MUSE SPARK	+ YOUR STYLE PROFILE	+ YOUR REAL MESSAGES
Form similarity **0.69**	Form similarity **0.92**	Form similarity **0.94**
chrF **41.8**	chrF **47.4**	chrF **54.0**

40 held-out pairs: a neutral draft → what the user really wrote. Muse Spark 1.3, only the prompt changes. **Live writer, Muse Spark Open (open weights) with the same prompt: form 0.93 · chrF 47.5** — same form, fewer of the user's exact words. Picking examples by meaning scored the same as random ones.

Form similarity = 1 – total variation of form features (length, case, punctuation, emoji, languages) vs the real messages, as in the app's style self-check. chrF = character n-gram overlap with the real message. Reruns vary by about 0.02 form / 2 chrF. Source: `eval/style_gain.py` → `eval/results/style_gain.json`, `style_gain_open.json`.

RESULTS · PERSONAL MODEL

The LoRA thinks first, then writes like you

REPLY LENGTH

24

chars · real 28 · earlier LoRA 38

FORM DISTANCE

0.07

vs 0.12 earlier LoRA (lower is better)

TONE MIX DISTANCE

0.05–0.07

vs 0.09 earlier LoRA

INTENT MATCH

46%

ceiling ~48% · guessing 36.8%

- 499 held-out test pairs. The model writes a short thought (intent + tone) in Glimmer's reasoning channel, then the message. Trained and benchmarked; not hosted live (no GPU credits).
- The intent is a control: agree, refuse, joke → three replies with different intents, all in your voice.
- **Blind test** (friends guess: real or SaySo?): TODO — results pending.

Source: `docs/PLAN_v4_thinking.md`, `eval/results/bench_v4.json`. Intent ceiling = how often the tagger agrees with itself.

PRIVACY BY DESIGN

Only your own writing is kept

- Trained and prompted **only on what you wrote**.
- Other people's messages are read **in memory** for context, then discarded.
- Uploads are parsed in memory (quoted email replies cut off); **screenshots, photos and voice notes are never stored**.
- The keyboard ignores password, email, URL, one-time-code and search fields.
- See **what it learned from you**; forget any rule.
- Delete a style at any time.
- No sign-up.
- Public repo holds code and aggregated numbers only — no messages, no data.

Positioning: authenticity and your own voice, human in the loop. Not "undetectable AI".

HOW IT SCALES

One base model, one small adapter per user

- **One shared Muse Glimmer 30B** base on the GPU.
- **Per-user LoRA adapters** swapped per request (multi-LoRA vLLM) — a new user adds an adapter, not a GPU.
- Users without their own LoRA yet run on Muse Spark Open + their style profile — open weights, so it can be self-hosted too.

Cost per active user / month: ≈ **$3** now → ≈ **$1–1.5** optimized. Estimates.

FREE

Muse Spark Open + your style profile

Styles from your chats, emails and essays; keyboard, Back Tap replies.

PRO · $6.99 / MONTH (ESTIMATE)

Your own LoRA on Muse Glimmer

A personal model trained on your own messages.

ROADMAP

What's next

Accounts

Sync styles across devices, beyond a single-device token.

LoRA training queue

Per-user adapters trained in the background as people upload chats.

Kazakh & more languages

Kazakh first, then any language people write in.

Android

The same keyboard and screenshot replies.

Thank you

SaySo — AI that writes the way you'd say it.

Try it, break it, tell us where it doesn't sound like you.
